1. The following is an examiner's statement of reasons for allowance:

The invention is directed to a cable containing a controller that connects a printer or peripheral to a host computer under normal operation. Claims 1 and 11 identifies the uniquely distinct features of "a memory that is external to the peripheral, contains demonstration data, and is coupled to the controller to enable the controller to read the demonstration data from the memory for the peripheral to perform a demonstration without being connected to the host computer" (claim 1) and "connecting the memory to the cable to enable the controller to read the demonstration data from the memory and format the data for the printer." (claim 11). The closest prior art Co-pending application U.S. Serial No. 09/675,195 teaches a conventional cable containing a controller that connects a printer or peripheral to a host computer; either singularly or in combination with other cited reference fails to anticipate or render the above underlined limitations obvious.

The Co-pending application U.S. Serial No. 09/675,194 requires the cable controller connected to a host to obtained demonstration data from the memory of the host while the claimed invention requires the cable controller connected to a memory, not a host.

The meaning of the sentence "a memory that is external to the peripheral, contains demonstration data, and is coupled to the controller" and "connecting the memory to the cable to enable the controller" is defined in applicant's specification, page 2, paragraph 6 and paragraph 7, and on page 4, paragraph 18.
